Professional Summary		
Information Technology graduate (B.Tech, 2026) with hands-on experience building and deploying web applications using Python and Flask. Developed two end-to-end projects integrating machine learning models, SQL databases, and web interfaces demonstrating ability to write clean, maintainable code from requirements to deployment. Proficient in Python, SQL, Git, and OOP, with a structured approach to problem-solving and application development. Quick learner with strong communication skills and a growth mindset, seeking to contribute to feature development and grow within an AI-powered software team under experienced engineers.		
Educational Qualification (2022 – 2026)		Bachelor of Technology in Information Technology. CGPA: 8.36. Sridevi Women’s Engineering College - Hyderabad
Professional Skills		
• Programming: Python • Web Technologies: HTML, CSS • Databases: SQL (MySQL) • Frameworks & Tools: Flask, Git • Machine Learning & AI: scikit-learn, Naive Bayes, SVM, Logistic Regression, Random Forest, XGBoost, CNN, Transformer, NLP, SHAP (Explainable AI) • Concepts: OOP, DBMS, Data Structures & Algorithms		
Academic Minor Project		
Project Title: <i>A Computer Aided Inspection System to Predict the Quality Characteristics in Food Technology.</i> • Developed a machine learning-based food quality prediction system using NLP to analyse customer reviews and classify products as good or bad. • Implemented multiple models with an ensemble voting classifier to improve prediction accuracy. • Built a web application using Flask and HTML/CSS with MySQL database integration for real-time prediction and data storage. • Designed a scalable solution to enhance food quality assessment using data-driven insights.		
Academic Major Project		
Project Title: <i>Enhancing Medicare Fraud Detection With a CNN-Transformer-XGBoost Framework and Explainable AI</i> • Developed a hybrid deep learning model combining CNN, Transformer, and XGBoost for improved healthcare fraud detection accuracy. • Performed data preprocessing, feature engineering, and handled class imbalance in large healthcare datasets. • Generated data visualizations to support fraud detection insights and decision-making. • Built a Flask web application with routes to handle user input and return real-time fraud predictions. • Integrated SHAP (Explainable AI) to provide transparent, feature-level insights for each prediction.		
Achievements		
• Served as a Team Leader in projects. • Participated in coding competitions focusing on problem-solving and algorithm design • Awarded a certificate for active participation in the Beyond Brushes creative competition.		
Certifications		
Programming Fundamentals Using Python - Infosys
